

## PHYSICS 12 GRAVITATION WORKSHEET 1

1. A 65 kg boy stands 1.5 m away from a 50 kg girl.
  - a) Calculate the force of attraction (gravitational, not the naughty kind) between them.
  - b) Determine the gravitational field strength of the girl at the boy's position.
2. Compute the value of  $g$  at a point in space that is  $7.0 \times 10^6$  m from the center of the Earth.
3. How much would a 60.0 kg person weigh on Mercury, given a planetary radius of  $2.43 \times 10^6$  m and a mass of  $3.20 \times 10^{23}$  kg?
4. Calculate the distance between two electrons that have a gravitational force of attraction of  $2.78 \times 10^{-70}$  N.
5. Two spherical balls are placed so that their centers are 2.6 m apart. The gravitational force of attraction between the two balls is  $2.75 \times 10^{-12}$  N. What is the mass of each ball if one is twice the mass of the other?
6. The radius of the Earth is  $6.4 \times 10^6$  m while that of Mars is  $3.4 \times 10^6$  m. If the mass of Mars is 0.107x the mass of the Earth, what would Normie Neutron, weighing 590 N on Earth, weigh on Mars?
7. Three balls are placed as shown. What are the magnitude and direction of the net gravitational force exerted on mass **Y** by mass **X** and mass **Z**?  

8. If the gravitational force between a planet of mass **M** and a satellite of mass **m** at distance **d** is **F**, what is the force (relative to **F**) exerted by another planet of mass **4M** on a satellite of mass **0.5m**, at a distance **2d**?
9.
  - a) Determine the force of attraction between a 130. kg satellite in orbit 265 km above the surface of Mercury, which has a planetary mass of  $3.2 \times 10^{23}$  kg and a radius of  $2.43 \times 10^6$  m.
  - b) What is the speed of this satellite in its stable orbit?
10. Find the average speed of the following planets as they orbit the Sun:
  - a) Mercury (orbital radius:  $5.80 \times 10^{10}$  m)
  - b) Saturn (mass:  $5.68 \times 10^{26}$  kg; orbital radius:  $1.43 \times 10^{12}$  m)
11.
  - a) Calculate the velocity that a cannonball must be shot at, horizontally from the top of Mt. Everest (altitude: 8850 m) in order to orbit the Earth, ignoring air resistance.
  - b) How long would it take for the ball to return to the cannon, in seconds and minutes?
12. A  $4.0 \times 10^3$  kg satellite orbits the planet in a circular orbit of radius  $2.0 \times 10^4$  km every  $1.0 \times 10^3$  s. What is the mass of the planet?

13. A 10 000 kg spaceship is drifting along on a long mission towards the outer edge of the solar system. It has put out a small experimental satellite of mass 25 kg which revolves around the ship at a distance of 120 m under their mutual gravitational attraction. Calculate:
- the period of revolution of the satellite as it orbits the ship.
  - the speed of the satellite in this orbit.
14. What would be the period of a spaceship orbiting the Earth at an altitude equal to the radius of the Earth?
15. A satellite circles a newly discovered planet in our solar system once every 98 minutes at a mean orbital radius of  $6.88 \times 10^6$  m. From this motion, calculate:
- the mass of the planet.
  - the centripetal acceleration acting on the satellite.
16. Astronomical observations indicate that the sun is tracing a circular orbit around the center of our galaxy. The radius of orbit is  $2.7 \times 10^{20}$  m with period  $T = 200$  million years.
- Calculate the total mass of the central stars.
  - Assume all of these stars have the same mass as our sun. How many does this represent?
17.
  - Determine the value of  $g$  on the Moon's surface.
  - What is the centripetal acceleration of any point on the moon's equator due to its rotation?
18. If a small planet were discovered whose distance from the sun was 8 times that of earth, how many times longer would it take to circle the Sun?

1. a)  $9.6 \times 10^{-8}$  N b)  $1.5 \times 10^{-9}$  N/kg 2. 8.1 N/kg 3. 217 N 4. 0.446 m 5. 0.37 kg & 0.75 kg 6.  $2.2 \times 10^2$  N  
 7. 0 8. 0.5F 9. a)  $3.8 \times 10^2$  N b)  $2.8 \times 10^3$  m/s 10. a)  $4.8 \times 10^4$  m/s b)  $9.6 \times 10^3$  m/s 11. a)  $7.90 \times 10^3$  m/s  
 b)  $5.08 \times 10^3$  s or 84.7 minutes 12.  $4.7 \times 10^{27}$  kg 13. a)  $1.01 \times 10^7$  s b)  $7.46 \times 10^{-5}$  m/s 14.  $1.43 \times 10^4$  s, or 4 hrs  
 15. a)  $5.57 \times 10^{24}$  kg b)  $7.86 \text{ m/s}^2$  16. a)  $2.9 \times 10^{41}$  kg b)  $1.5 \times 10^{11}$  stars 17. a) 1.6 N/kg b)  $1.2 \times 10^{-5} \text{ m/s}^2$   
 18. 22.6 times
